

**COURSE TITLE:**

---

**BEGINNER PYTHON  
PROGRAMING.**

**COURSE DURATION: 8 WEEKS**

**CLASS SCHEDULE: 2 HOURS**

**SESSIONS: 3 SESSIONS A WEEK**

# WHAT YOU WILL LEARN FROM THE COURSE

- ✦ Programming Concept
- ✦ Getting Started with Python
- ✦ Learning Python Data Types
- ✦ Understanding Python Operators
- ✦ The Concept of Variables
- ✦ Conditionals & Loops

# PROGRAMMING CONCEPT

### ▶ DAY ONE:

- ▶ Introduce the tutor and the course
- ▶ Ask every student why they decided to join
- ▶ Talk openly with the students on programming without necessarily attributing it to computers

### ▶ DAY TWO:

- ▶ Continue open discussion on programming
- ▶ Give simple examples
- ▶ Ask the students to come up with some examples

### ▶ DAY THREE:

- ▶ Give them exercises to do at home and in class
- ▶ Ensure the concept of programming is well understood through the use of more simple examples

# WHAT PROGRAMMING:

- ▶ Programming is the art of solving problems using computer.
- ▶ Programmers write programs that communicate with the computer.
- ▶ The computer does not understand your language.
- ▶ Thus the need for a programmer to write a program that is understood by a compiler.
- ▶ The compiler in turn changes the programmer's code into a readable binary code.
- ▶ Which is then executed by the computer.

# SOME POPULAR SOFTWARE

- ▶ Web Apps:
  - ▶ Google
  - ▶ Youtube
- ▶ Desktop Apps:
  - ▶ Microsoft Office Word
  - ▶ iTunes
- ▶ Mobile Apps:
  - ▶ Snapchat
  - ▶ Instagram

# BRIEF INTRODUCTION TO PYTHON

- ▶ Python is a high level programming language created by Guido Rossum In 1991.
- ▶ It is an interpreted language.
- ▶ It is object oriented.
- ▶ Indentation matters.
- ▶ It is highly readable.
- ▶ Very easy to learn.
- ▶ Has various available libraries to help you.
- ▶ And a large community of developers to guide you.

# PYTHON IN THE REAL WORLD

- ▶ Python is used in various places.
- ▶ In web applications such as Google, Qoura and Instagram.
- ▶ In Artificial Intelligence and Machine Learning e.g. in building image verification and identification systems, robots; driverless cars for example.

# GETTING STARTED WITH PYTHON

## ▶ DAY ONE:

- ▶ Here the tutor makes sure every student know how to setup the python interpreter on their computer be it a Mac or a PC. This may take a whole day

## ▶ DAY TWO:

- ▶ The students will then repeat the process the following day and ensure that they have mastered the process

# GETTING STARTED WITH PYTHON

- ▶ To start using python, one needs to install it.
- ▶ MacBooks come along with python 2 preinstalled.
- ▶ Python 3 is the latest version
- ▶ Python can be downloaded from <http://python.org>
- ▶ Once installed, it can be started from the Terminal or Command Prompt
- ▶ Can be started by writing the 'python' command on the terminal console
- ▶ >>> should indicate the python prompt is ready

## PYTHON DATA TYPES

### ▶ DAY THREE:

- ▶ List out all the relevant data types in python and give an example of each
- ▶ Introduce variables and explain them clearly
- ▶ Valid and Invalid variable names
- ▶ Work with the students to come up with examples
- ▶ Give assignment on variable names

# PYTHON DATA TYPES

- ▶ Integers
- ▶ Floats
- ▶ Boolean
- ▶ String
- ▶ List
- ▶ Tuple
- ▶ Dict

# PYTHON DATA TYPES

## ▶ DAY ONE:

### ▶ Strings

- ▶ What makes a string
- ▶ Examples and types
- ▶ Uses
- ▶ Work with students to understand the makeup of a string
- ▶ Every student should write an example string on the shared screen
- ▶ Give class work; students should write 10 string examples
- ▶ Assignment: Students should come up with 10 more string examples

# PYTHON DATA TYPES

- ▶ DAY TWO:

- ▶ Strings

- ▶ String and variables

- ▶ String concatenation

- ▶ Class exercise on string concatenation

- ▶ Assignment on string concatenation

# PYTHON DATA TYPES

## ▶ DAY THREE:

### ▶ Strings

- ▶ What are string methods
- ▶ Get a glimpse of 10 string methods to be treated
- ▶ Work the students through the 10 string methods and their uses
- ▶ Show the class how they can get access to all available string methods
- ▶ Show the class how google can be used to read more on string methods

# PYTHON DATA TYPES

- ▶ DAY ONE:
  - ▶ Strings
    - ▶ Treat 4 string methods
    - ▶ Do class exercise for each
    - ▶ Give assignment on each

## PYTHON DATA TYPES

- ▶ DAY TWO & THREE:

- ▶ Strings

- ▶ Treat 3 string methods for each day
    - ▶ Do class exercise for each string method
    - ▶ Give assignment on each string method

# PYTHON DATA TYPES

## ▶ DAY ONE:

### ▶ List

- ▶ What makes a list
- ▶ Examples and types
- ▶ Uses
- ▶ Work with students to understand the makeup of a list
- ▶ Every student should write an example list on the shared screen
- ▶ Give class work; students should write 10 list examples
- ▶ Assignment: Students should come up with 10 more list examples

# PYTHON DATA TYPES

## ▶ DAY TWO:

### ▶ List

- ▶ List and variables
- ▶ List concatenation
- ▶ Class exercise on list concatenation
- ▶ Assignment on list concatenation

# PYTHON DATA TYPES

- ▶ DAY THREE:

- ▶ List

- ▶ List Methods

- ▶ Append

- ▶ Insert

- ▶ Pop

# PYTHON DATA TYPES

- ▶ DAY ONE:

- ▶ List

- ▶ List Methods

- ▶ Extend

- ▶ Remove

- ▶ Clear

# PYTHON DATA TYPES

- ▶ DAY TWO & THREE:

- ▶ List

- ▶ Class Exercises on List Methods

- ▶ Assignments on List Methods

# PYTHON DATA TYPES

- ▶ DAY ONE:

- ▶ List

- ▶ Class Exercises on List Methods

- ▶ Assignments on List Methods

# ARITHMETIC OPERATORS

- ▶ Addition +
- ▶ Subtraction -
- ▶ Multiplication \*
- ▶ Division /
- ▶ Modulus %
- ▶ Exponent \*\*

# COMPARISON OPERATORS

- ▶ == Equal
- ▶ != Not Equal
- ▶ > Greater than
- ▶ < Less than
- ▶ >= Greater or equal
- ▶ <= Less or equal

# ASSIGNMENT OPERATORS

▶ `=`

▶ `+=`

▶ `-=`

▶ `*=`

▶ `/=`

▶ `**=`

▶ `%=`

# LOGICAL OPERATORS

- ▶ And
- ▶ Or
- ▶ Not

# MEMBERSHIP OPERATORS

- ▶ In
- ▶ Not in

# VARIABLES

- ▶ Variables are objects that hold some value.
- ▶ They are case sensitive.
- ▶ Can be named anything so long it starts with an alphabet (A-Z, a-z) or an underscore (\_).
- ▶ Some names are unfortunately already taken e.g. class, return, try, except.
- ▶ Their value can be changed; including their data types.

# CONDITIONALS

- ▶ IF
- ▶ Else
- ▶ Else if

# LOOPS

- ▶ For loop
- ▶ While loop

# FUNCTIONS

- ▶ A function is a group of code that is defined to serve a certain purpose.
- ▶ Functions are defined and then called to be used.
- ▶ Once defined, a function can be used numerous times.

# SOME BUILT-IN FUNCTIONS

- ▶ `print()`
- ▶ `type()`
- ▶ `len()`
- ▶ `str()`
- ▶ `int()`
- ▶ `max()`
- ▶ `min()`
- ▶ `range()`
- ▶ `format()`
- ▶ And many more

# CLASSES

- ▶ A class is a group of functions that serve a certain purpose and are only accessible within the class.
- ▶ Functions within a class are accessed using dot notation
- ▶ A class needs a constructor.

# MODULES

- ▶ A module is a python file that contains a piece of code; either functions, classes or both that are used to serve a certain purpose.
- ▶ Some useful built-in modules include:
  - ▶ csv
  - ▶ random

# PACKAGE

- ▶ It is a group of modules in a directory
- ▶ Folder most contain `__init__.py` file
- ▶ Example of a package: Flask

## A QUICK INTRODUCTION TO FLASK

- ▶ Flask is a web framework developed in python for python
- ▶ It helps easily build a web application
- ▶ You can get up and running in a few lines
- ▶ Sometimes it feels like magic ;)

THANKS

---

**THANK YOU FOR PARTICIPATING,  
WISH YOU THE BEST IN YOUR  
PROGRAMMING JOURNEY.**

**Nasir Mustapha**
